Professional Summary

Full Stack Developer with 6+ years building real-time trading and financial platforms, combining strong frontend skills (React, TypeScript, JavaScript) with scalable backend services (Java, Spring Boot, REST APIs, WebSocket-based real-time data). Direct experience building event-driven systems processing 200K+ trading events per hour at sub-100ms latency — the same real-time, high-throughput requirements behind trading visualization and reporting tools. Comfortable designing intuitive, data-dense user interfaces as well as the backend services that power them, having delivered fullstack features end-to-end on regulated financial platforms. Proficient with MySQL and PostgreSQL; genuine interest in trading and financial markets built through hands-on production experience, not just enthusiasm. Object-oriented design background in Java; working knowledge of Python.

Technical Skills

Web Client	HTML, CSS, JavaScript (ES6+), TypeScript, React, responsive UI design, data visualisation components
Real-Time & APIs	REST API design, WebSockets, real-time data streaming, event-driven architecture, low-latency system design
Backend	Java 17/21, Spring Boot, Node.js (working knowledge), microservices, OOP design, Python (working knowledge)
Trading & Financial Systems	Trading event processing (200K+/hour), sub-100ms latency optimisation, market data pipelines, financial reporting
Databases	PostgreSQL, MySQL, MongoDB, query optimisation, schema design, time-series-style event data
Source Control & DevOps	Git, GitLab CI/CD, Docker, Kubernetes, AWS, GCP, zero-downtime deployment pipelines
Testing & Quality	JUnit, TDD, integration testing, contract testing, code reviews, structured logging & monitoring
Collaboration	Cross-functional collaboration with traders/operations-equivalent stakeholders, Agile/Scrum, requirement gathering

Professional Experience

Quantum Mortgages, Remote UK

Jan 2025 – Present

SENIOR JAVA FULL-STACK ENGINEER

- Build and maintain fullstack features for a regulated financial platform: React/TypeScript SPA frontend integrated with Spring Boot REST APIs, processing 50K+ application events daily across cloud infrastructure (AWS, GCP, on-premises).
- Design intuitive, data-dense interfaces for financial workflows, collaborating directly with business stakeholders to gather requirements and translate them into real-time, usable visualisations and reporting tools.
- Optimise PostgreSQL and MySQL query performance, reducing page load time from 2.5 seconds to under 800ms. Implement Redis caching reducing peak database load by 60% under high-traffic conditions.
- Lead architectural decisions across 12 microservices; mentor 4 engineers on frontend/backend integration patterns and API design. Implement OAuth2 and secure authentication across all service boundaries.

AnTeCoS GmbH, Waghäusel, Germany

Aug 2024 – Present

FUNCTIONAL SAFETY AND CYBERSECURITY ENGINEER

- Develop and maintain validated backend systems in safety-critical environments, processing 50K+ records with 99.8% data accuracy through systematic validation logic and rigorous testing.
- Establish automated integration testing framework reducing manual test cycle time by 35%. Implement production-safe upgrades and compatibility testing without service disruption.
- Apply object-oriented design principles and structured documentation practices across all system components, supporting long-term maintainability.

TAPP Engine, Remote USA

Mar 2024 – Dec 2024

JAVA BACKEND ENGINEER — TRADING PLATFORM

- Architected event-driven backend services for a financial trading platform processing **200K+ trading events per hour at sub-100ms latency** — directly relevant real-time processing experience for trading visualisation and reporting tools. Designed Kafka-based streaming pipelines with zero message loss across 8 distributed services.
- Built REST APIs and real-time data pipelines feeding downstream analysis and reporting systems, ensuring low-latency delivery of trading event data to consuming services.
- Optimised PostgreSQL and MongoDB queries through systematic performance analysis, reducing transaction processing time by 60% (450ms to 180ms). Implemented 15+ strategic indexes eliminating N+1 patterns under production trading load.
- Delivered comprehensive JUnit test suites (45+ critical paths, 12+ integration tests per microservice) and contract testing, reducing production incidents from 8 to 2 per month.
- Built GitLab CI/CD pipelines (Git-based version control) enabling 25+ zero-downtime deployments daily. Implemented structured logging and distributed tracing across 500K+ events daily, reducing MTTR from 45 to 12 minutes.

Catalyst IT Solutions, Karachi, Pakistan

Aug 2020 – Feb 2024

JAVA BACKEND DEVELOPER

- Built and maintained Spring Boot microservices and REST APIs handling 10K+ daily financial transactions, with API versioning supporting 3 major versions and full backward compatibility across 18 months.
- Applied object-oriented design and JPA/Hibernate data modelling to achieve 99.5% query accuracy. Optimised MongoDB query patterns reducing average response time from 800ms to 320ms.
- Reduced regression bugs by 70% through comprehensive integration testing. Collaborated with business stakeholders to translate financial reporting requirements into technical implementations.

Education

Technische Universität Ilmenau, Germany
M.Sc. COMPUTER AND SYSTEMS ENGINEERING

2024 – Ongoing

SZABIST, Pakistan
B.Sc. COMPUTER SCIENCE

2015 – 2019
